

Komet Composite Polisher

Komet's new yellow composite polishers offer a time-saving alternative to multi-step polishing systems by achieving a high-shine glossy surface on composite and ceramic materials in one quick step, after first contouring the surface with tungsten carbide finishers. The polishers utilize ultra-fine diamond grit and have a flexible, heat-resistant silicon bond which makes them suitable for sterilization in the autoclave. It also provides elasticity for adaptation to the anatomy of the tooth. The polishers ideally complement Komet's Q-Finishers.
