

## Composite Polishers ▼

These newly developed polishers are designed to achieve a high-shine glossy surface on composite and ceramic materials in one quick step, after first contouring the surface with tungsten carbide finishers. The company claims that by eliminating the need for multi-step polishing systems, the new polishers will enable the user to save time in the trimming and polishing process. The polishers have a flexible, heat resistant silicone bond which makes them suitable for sterilization in the autoclave and provides elasticity for adaptation to the anatomy of the tooth. They

are colour-coded (white ring for ultra fine) in line with diamond grit colour-codes to ensure easy identification.
